Canadian Technical Report of Fisheries and Aquatic Sciences No. 2308

CORRECTION

Recent corrections to the Larval Herring Program ichthyoplankton database changed the sample processing codes for Bay of Fundy surveys occurring before 1981. Consequently, the absence of cod eggs in the plots for cruises P151, P160, P175 and P207, occurring on pages 29, 34, 39, 44 and 49, and of cod larvae in the plots for cruise P190, on pages 54 and 59, are a reflection of the sorting practices and are not an indication of their absence. Similarly, the absence of length data for the two cod larvae reported as caught by cruise P180 cast doubt on the validity of these two observations. Because of this inconsistency, plots for cruise 180 on pages 54 and 59 may not accurately portray the distribution of cod larvae.

Lastly, cruise N770 was incorrectly placed in Table 4 and Figure 3 because of an error in the field survey type. This was a Scotian Shelf and not a Georges Bank survey.
